

CLAIMS

1. A computer-implemented method for monitoring domain name
5 registrations, said method comprising:

(a) receiving a request to monitor a name;

(b) searching a database of domain name registrations to identify one
or more registrations of domain names that match the name being monitored;
and

10 (c) notifying the requestor of the identified one or more registrations.

2. A computer-implemented method as recited in claim 1, wherein said
notifying (c) is performed by electronic mail.

15 3. A computer-implemented method as recited in claim 1, wherein the
name pertains to a domain name.

4. A computer-implemented method as recited in claim 1, wherein said
searching (b) searches a plurality of databases of domain name registrations.

20 5. A computer-implemented method as recited in claim 1, wherein the
name to be monitored is an identified string of characters.

25 6. A computer-implemented method as recited in claim 5, wherein said
searching (b) identifies those domain name registrations that are for domain
names that include the identified string of characters.

7. A computer-implemented method as recited in claim 1, wherein said searching (c) searches recent registrations.

8. A computer-implemented method as recited in claim 1, wherein said notifying (c) comprises:

(c1) producing a notification message pertaining to the identified one or more registrations; and

(c2) forwarding the notification message to the requestor.

9. A computer-implemented method as recited in claim 8, wherein the notification message includes at least registrant, date of registration and contact information for each of the identified registrations.

10. A computer-implemented method as recited in claim 1, wherein said receiving (a) comprises receiving monitoring request data from a requestor, the monitoring request data being provided through interaction with a web site accessible via the Internet.

11. A computer-implemented method as recited in claim 1, wherein said method further comprises:

(d) sending warning messages to registrants of the identified one or more registrations.

12. A computer-implemented method as recited in claim 11, wherein said sending (d) of the warning messages is done automatically for the requestor or on specific request by the requestor.

13. A computer-implemented method for monitoring domain name registrations, said method comprising:

(a) registering a name to be monitored for a requestor;

(b) searching at one or more registration databases to identify one or more registrations of domain names that are similar to that of the name to be monitored; and

5 (c) notifying the requestor of the identified one or more registrations.

14. A computer-implemented method as recited in claim 13, wherein said notifying (c) is performed by electronic mail.

10 15. A computer-implemented method as recited in claim 13, wherein the one or more registration databases are associated with one or more registrars.

16. A computer-implemented method as recited in claim 13, wherein the
15 name pertains to a domain name.

17. A computer-implemented method as recited in claim 13, wherein the name to be monitored is an identified string of characters.

20 18. A computer-implemented method as recited in claim 17, wherein said searching (b) identifies those registrations that are for domain names that include the identified string of characters.

19. A computer-implemented method as recited in claim 13, wherein said
25 searching (c) searches recent registrations.

20. A computer-implemented method as recited in claim 13,
wherein the name to be monitored is a character string, and

wherein the identified one or more registrations of domain names that are similar to the that of the name are those that include the character string.

21. A computer-implemented method as recited in claim 13, wherein said
5 notifying (c) comprises:

(c1) producing a notification message pertaining to the identified one or more registrations; and

(c2) forwarding the notification message to the requestor.

22. A computer-implemented method as recited in claim 21, wherein the
10 notification message includes at least registrant, date of registration and contact information for each of the identified one or more registrations.

23. A computer-implemented method as recited in claim 13, wherein said
15 registering (a) comprises receiving registration data from the requestor, the registration data being provided through interaction with a web site accessible via the Internet.

24. A computer-implemented method as recited in claim 13, wherein said
20 method further comprises:

(d) sending warning messages to registrants of the identified one or more registrations.

25. A computer-implemented method as recited in claim 24, wherein said
25 sending (d) of the warning messages is done automatically for the requestor or on specific request by the requestor.

26. A computer-implemented method as recited in claim 13, wherein said method further comprises:

(d) monitoring activation of a website at the domain names of the identified one or more registrations.

27. A computer-implemented method as recited in claim 26, wherein said method further comprises:

(e) informing the requestor of the activation of a website at the domain names of the identified one or more registrations.

28. A system for monitoring domain name registrations stored to a domain name registration database utilized by a registrar of domain names, said system comprising:

a monitoring database that stores monitoring information, the monitoring information specifying at least one requestor and at least one domain character string to be monitored for the requestor; and

a domain monitoring server operatively connected to said monitoring database, said domain monitoring server operates to search the domain name registration database for matching or similar domain name registrations to that of the at least one domain character string, produce a registration report identifying those of the matching or similar domain name registrations, and forward the registration report to the requestor.

29. A system as recited in claim 28,

wherein said domain monitoring server operates to periodically search the domain name registration database for matching or similar domain name registrations, and

wherein said domain monitoring server operates to receives the monitoring information provided by at least one requestor through interaction with said domain monitoring server via a network and to store the monitoring information to said monitoring database.

30. A system as recited in claim 29, wherein said domain monitoring server forwards the registration report to the requestor over the network as electronic mail message, the registration report including at least registrant, date of registration and contact information for each of the identified matching or similar domain name registrations.
